Readiness Review and Discrepancy Handoff

Instructor guide | 90 minute lesson | Version 1.0 | 17 October 2026

This lesson prepares learners to reconcile a readiness packet with source records, hand off discrepancies and preserve an evidence-based recommendation. The practical result is a traceable exception summary and a proposed training improvement, not authorization to operate equipment.

Scope and use

Use only the supplied fictional records. The lesson covers administrative review, source control, communication and instructional improvement. It contains no flight instruction, equipment procedures or service qualification standard. It is independently developed and does not imply company sponsorship or service approval.

Observable learning objectives

O1 Cite the controlling record and expected versus observed values for each material finding.

O2 Prepare a handoff that separates proposed ownership and dates from recorded acceptance.

O3 Apply the exercise disposition rule and preserve the Demo event lead decision authority.

O4 Connect an AAR to a process correction and a revised learner task with an observable standard.

Proposed conditions and standard

Plan for one facilitator and up to four learners, each with the learner packet and a blank worksheet. Use a separate evaluator when practical. Learners work individually before discussion. Proposed completion: at least 16 of 18 rubric points with full credit on every critical criterion. These timings, staffing assumptions and thresholds require pilot validation.

Materials

Learner packet pages 1 to 5; evaluator guide and answer key; a pen or editable Word copy; optional computer for the public HOPS loop. Keep the answer key separate until assessment is complete. The full package is public and is not a secure examination.

Run the lesson

Minute	Activity	Facilitator action
0 to 10	Frame the task	Explain source priority, available versus held stock, proposed versus accepted handoffs and the limit of a recommendation.
10 to 20	Demonstrate	Use the separate micro-example below. Model fact, source, implication and next action without revealing exercise answers.
20 to 45	Independent review	Issue learner records. Observe without supplying findings. Learners complete the discrepancy and handoff worksheets.
45 to 60	Brief and assess	Each learner gives a 60 second exception brief. Evaluate the submitted work; limit feedback to the criteria.
60 to 80	HOPS follow-through	Build one process-improvement record. Use the online loop or the equivalent paper fields. Keep review pending without assessment evidence.
80 to 90	Debrief	Compare source use, owner acceptance and disposition. Capture one lesson change and pilot feedback.

Worked micro example

Use an unrelated office-supply record: a meeting plan requires 10 printed folders; the signed count shows nine. State the one-folder gap, cite the count, propose a records owner and request confirmation. Do not change the count to 10 because the meeting is scheduled.

Facilitation prompts

Which record establishes the requirement, and which record records the observed state?

What do you know, what are you proposing and what still needs acceptance?

Which condition prevents a READY recommendation under this exercise rule?

What would constitute evidence that the process correction worked?

Do not coach learners toward a fixed number of rows. Findings may be consolidated or split when the underlying facts remain clear and fully traceable.

Connect the lesson to HOPS

Use the HOPS improvement loop at https://seankaspar92.github.io/Portfolio/hops.html#improvement-loop. Each browser keeps its own record. Export the JSON packet before leaving; no shared backend is implied.

Loop record	What the learner records
Issue	Late reconciliation of the synthetic readiness packet; cite RR02 through RR05. Keep the observed inventory and documentation gaps visible.
Owner and date	A proposed process owner and follow-up date. State that classroom role labels are not authenticated identities.
AAR	Expected reconciliation before final review; observed mismatches; proposed cause; source references. A cause is a hypothesis until supported.
Corrective action	Add source reconciliation, owner/date completeness checks and an explicit HOLD path before the packet recommendation.
Correction evidence	Use the evaluator supplied ED01 administrative addendum only after the independent assessment. It updates the record, not the physical stock or CASE-B revision.
Training revision	An independent learner comparison task with a source-citation and handoff standard. Record the change from the prior task.
Evaluation and closure	Leave pending until an evaluator observes the proposed criterion. If using the synthetic demonstration, label the evidence as simulated. A failed check cannot close the loop.

Important distinction

The process problem is late or inaccurate reconciliation. Correcting that process can produce an accurate HOLD record while the two-item stock gap and CASE-B document mismatch remain unresolved. Neither an exported packet nor a closed synthetic process loop makes the event ready.

Paper fallback

If the site is unavailable, use the learner worksheet to retain the same record IDs, owners, dates, source references, task revision and pending review state. Do not treat paper completion as software verification.

Pilot and improve the lesson

Before the pilot

Confirm that the local audience needs document review and handoff practice. Do not substitute this lesson for product-specific instruction.

Read the evaluator guide and rehearse the five reference findings. Print the learner packet without the answer key.

Confirm that learners can read the tables and access either the Word worksheet or a printed copy. Permit large print or extra space as needed.

Agree on the proposed rubric and critical criteria before scoring. Record any adaptation as a new lesson version.

Collect pilot evidence

Measure	Record
Timing	Actual minutes used in each lesson phase and tasks left incomplete.
Performance	Rubric scores by criterion, critical misses and the evidence cited.
Scoring consistency	Differences between evaluators and how they were resolved.
Usability	Records learners misread, unclear terms and access or layout problems.
Improvement	Specific change, accountable editor, revised version and method for checking the change.

Remediation and reassessment

Use the criterion-specific remediation in the evaluator guide. Reassess with changed labels and quantities on equivalent records, not the memorized answer key. Preserve the original attempt and record which criteria were reassessed. Instructor designation and qualification remain outside this lesson.
