# Readiness Review and Discrepancy Handoff

Evaluator guide and answer key | Keep separate during independent work

Use this key to assess the evidence chain rather than matching a fixed sentence or row count. These are the five material reference findings. Award credit for equivalent, traceable reasoning; do not count a defensible split or combined entry as an error.

### D01 Reference finding

Six available support packs against eight required; two held items do not count as available.

Evidence: RR01, RR02, RR03. Next action: Correct the packet to six available and keep the two-item gap visible. Route the shortage for an owner decision; do not invent replacement stock.

### D02 Reference finding

CASE-B has documentation revision B; the control card requires revision C. The packet claims C for both cases.

Evidence: RR01, RR02, RR04. Next action: Record the version mismatch and route it to the documentation lead. Do not assume the case has been updated.

### D03 Reference finding

H01 has no accountable issue owner. An intake entry is not an accepted ownership handoff.

Evidence: RR01, RR05. Next action: Propose a named accountable role, due date and acceptance request. Keep proposed assignment distinct from recorded acceptance.

### D04 Reference finding

H02 has a named owner and recorded acceptance but no due date.

Evidence: RR01, RR05. Next action: Request and record an agreed follow-up date; the learner may propose one but may not call it accepted without evidence.

### D05 Reference finding

The final packet recommends READY despite the later source records and unresolved handoff controls.

Evidence: RR01, RR02, RR03, RR04, RR05. Next action: Recommend HOLD FOR REVIEW under the exercise rule and send the exception summary to the Demo event lead. Do not claim event authorization.

### Correct records that are not seeded discrepancies

Both control cases are present. Label kits and document sets meet their quantities. CASE-A is at revision C. H02 has an owner and a recorded acceptance; its missing field is the due date. Do not reward invented gaps or assume a physical repair is needed.

# Criterion based assessment rubric

Score each criterion 0, 1 or 2. 0 means absent, materially wrong or unsupported. 1 means partly correct but incomplete. 2 means the full-credit anchor is met. Proposed pass: 16 of 18 points, with every critical criterion at 2. The threshold is a design choice to validate in the pilot.

### R1 Source traceability Critical

Cites document IDs and the expected and observed values for all material findings.

Score 0 1 2 Evidence or observed gap _____

### R2 Available inventory Critical

States six available against eight required and excludes the two held items from available stock.

Score 0 1 2 Evidence or observed gap _____

### R3 Revision mismatch Critical

Identifies CASE-B revision B versus required C and does not claim an unobserved update.

Score 0 1 2 Evidence or observed gap _____

### R4 Owner handoff

Identifies H01 missing owner; distinguishes a proposed owner from accepted ownership.

Score 0 1 2 Evidence or observed gap _____

### R5 Due date handoff

Identifies H02 missing due date; records a proposed follow-up without inventing agreement.

Score 0 1 2 Evidence or observed gap _____

### R6 Readiness disposition Critical

Recommends HOLD FOR REVIEW, explains why and names the Demo event lead as decision authority.

Score 0 1 2 Evidence or observed gap _____

### R7 Actionable communication

Provides a concise issue, impact, source, next action, proposed owner/date and acceptance request.

Score 0 1 2 Evidence or observed gap _____

### R8 HOPS and training linkage

Links the AAR, process correction and a revised learner task with an observable standard.

Score 0 1 2 Evidence or observed gap _____

### R9 Evidence integrity Critical

Keeps unresolved shortages and revision gaps open; does not invent closure, acceptance or qualification.

Score 0 1 2 Evidence or observed gap _____

*Critical criteria are R1, R2, R3, R6 and R9. A high total cannot offset a critical failure. Partial scores and comments must identify the missing evidence, not merely state that the answer was weak.*

# Administrative correction and HOPS reference

## ED01 Synthetic administrative correction addendum

Supply this addendum after the independent review, not as an original learner source. It demonstrates correction of the preparation record and handoff process. It does not supply replacement items or update CASE-B.

| Record | Corrected synthetic entry |
|---|---|
| Available stock | Support packs 6 available and 2 held against 8 required. The two-item gap remains OPEN. |
| Document state | CASE-A revision C; CASE-B revision B. H02 remains OPEN pending documentation review. |
| H01 handoff | Demo logistics lead; proposed follow-up 22 Oct 1700 UTC; classroom owner acceptance simulated for this addendum only. |
| H02 handoff | Demo documentation lead; proposed follow-up 22 Oct 1730 UTC; acceptance of this date must be recorded in the classroom exercise. |
| Readiness recommendation | HOLD FOR REVIEW. Demo event lead retains the event decision. |
| Process change | Reconcile the source records and confirm owner/date completeness before the final packet recommendation. |

## HOPS reference outputs

Issue: late reconciliation. AAR: the packet was recommended READY after source mismatches were recorded. Proposed cause: no source-reconciliation checkpoint or owner/date completeness check before recommendation. Action: add those checks and a HOLD route. Correction evidence: ED01, with unresolved technical conditions visible.

Proposed training task: given a fresh set of synthetic records, identify all seeded material discrepancies, cite the controlling and observed records, and submit a handoff and recommendation without unsupported acceptance or closure. The task revision must explain what changed from familiarization or a group walkthrough.

The sample HOPS JSON ends at TRAINING_REVISED. It intentionally contains no passed evaluation or closure. A reviewer must observe the criterion before recording a simulated result. Browser reviewer labels do not establish identity or operational authority.

# Feedback remediation and pilot record

| Gap | Remediation and reassessment |
|---|---|
| Sources or inventory | Have the learner annotate RR01 and RR03, separate available from held quantities, then repeat using new quantities. |
| Revision state | Compare required and observed revision fields using a new case label. Do not infer an update from a planned action. |
| Owner or date | Rebuild one handoff with explicit proposed and accepted states, then assess a new missing-field example. |
| Readiness or integrity | Require the learner to apply the stated HOLD rule and explain why a recommendation is not event authorization. |
| HOPS or communication | Rebuild the issue to task chain and give a concise brief; require current evidence before simulated review. |

## Assessment decision

Learner identifier _____ Evaluator _____ Date _____

Total _____ / 18 All critical criteria at 2 YES / NO Proposed result PASS / REMEDIATE

Evidence supporting the result and critical misses

_____

_____

Remediation assigned and reassessment scope

_____

_____

## Instructor extension

Optional additional 15 minutes outside the 90 minute lesson: the learner teaches a five minute source-comparison segment, observes a peer attempt, scores it against two criteria and explains the remediation. Record this separately. It does not grant instructor designation.

## Pilot review

Record actual timing, scoring disagreements, false-positive findings and unclear record fields. Revise the lesson only with a named editor, version change and a planned check. Do not publish learning improvement or operational impact without pilot evidence.
